

Quick Start

Your offline roadbook for bikepacking and ultra-distance rides. Drop in a route and Rekker tells you where you can eat, drink and rest along it, and whether those places are open by the time you actually get there. All on your phone, with zero signal.

1 Plan your route, waypoints first

Best started on a computer, since that is usually where your GPX file already lives. Waypoints are the backbone of your roadbook: they cut the ride into legs, and everything else hangs off them. Two settings:

- **Waypoint interval** – how often a waypoint is placed (e.g. every 40 km). It is how you read the ride: in clear chunks, not one overwhelming line.
- **Speed** – your honest average pace. Sets the ETA at every point, so Rekker knows what is open when you will be there.

Tap Generate and your roadbook is built.

2 Get it on your phone

Planned on a computer? Scan the QR code (or enter the share code) to open the exact same roadbook on your phone, no re-uploading and no account.

- Add it to your home screen so it runs like a real app and works fully offline from there on:
- **iPhone (Safari):** Share, then Add to Home Screen.
- **Android (Chrome):** three-dot menu, then Install app.
- Planning straight on your phone instead? Same idea: open it once online so it stores everything, then it keeps working with zero signal.

3 Read it on the road

Each leg lists the shops, fuel, bakeries and water ahead. Per place you see:

- The kilometre, and how far it sits off your line.
- Whether it is open at your arrival time, not the clock right now. Closed places dim out.
- Step leg by leg with the back/forward buttons, or tap a waypoint to jump there.

4 Favourites: prepare once, then follow them

This is the heart of it.

- While planning at home, tap the star on the shops, taps and stops you will actually use.
- On the road, switch the filter to Favourites and the noise falls away: only your chosen points.
- You did the thinking in advance; now you just ride from favourite to favourite.

5 Make it your own

- Open My points to add a stop at any kilometre: a Control, a Sleep (hotel/camp), an Eat, or a Ferry you must catch.
- Controls and ferries already in your GPX are picked up automatically.
- Manage or remove your own points in that same list.

6 Adjust on the move

- Tap the gear (Settings) any time to change your speed or waypoint interval. Every ETA updates instantly.
- Hidden there: show cemetery taps. Cemeteries almost always have a working tap, handy extra water when the route runs dry.

7 The map

- The Map tab draws your whole route as one line, with your position, waypoints and favourites.
- Pinch to zoom; tap a point to open it in Google Maps.

Good to know

- **~est.** means an estimated opening time, not confirmed. When in doubt, trust the dimmed CLOSED.
- **Distances are straight-line** from your route, not walking distance. A point can sit across a road or river, so tap it to check the real access in Google Maps.
- **Offline coverage:** NL, BE, LU, FR, DE, IT, CH and AT. Elsewhere works while online.
- **Free during beta** – no account, no cloud.
